

G S I P A T H W A Y S T O T H E F U T U R E : R E S P O N S I B I L I T Y

IMPORTANCE OF RESPONSIBILITY

As populations grow and demand for protein also increases, aquaculture offers great potential in helping meet that demand.

However, we must act responsibly.

As GSI members we believe that responsible use of our world's resources, including the oceans, is critical for the long-term sustainability of the aquaculture industry, and the environments and communities in which we operate.

RESPONSIBLE AQUACULTURE

Oceans are a shared resource and the actions of the few impact upon the many. For this reason, all GSI members are committed to responsible production through:

- Minimizing environmental impact
- Ensuring healthy fish
- Supporting and contributing to local communities
- Responsible use of resources

To demonstrate accountability, GSI members are committed to acting responsibly in a variety of ways:

- **Operating to the highest levels of ocean stewardship** through achieving the most robust seafood certification: [Aquaculture Stewardship Council](#)
- **UN Sustainable Development Goal** (UN SDG) 14—a call to conserve and sustainably use the oceans
- **Working with local communities** to inspire and educate responsible ocean use

We continue to put responsibility at the heart of our GSI vision for the future of aquaculture; and acknowledge our role in not only acting as responsible corporate citizens, but in ensuring the responsible use of the oceans for future generations.
